Charging method

-When the battery is low or when using it for the first time, please fully charge it.

Rechargeable batteries will gradually deteriorate after repeated charging/use. It may be used less than expected, not a malfunction.

The rechargeable battery cannot be replaced.

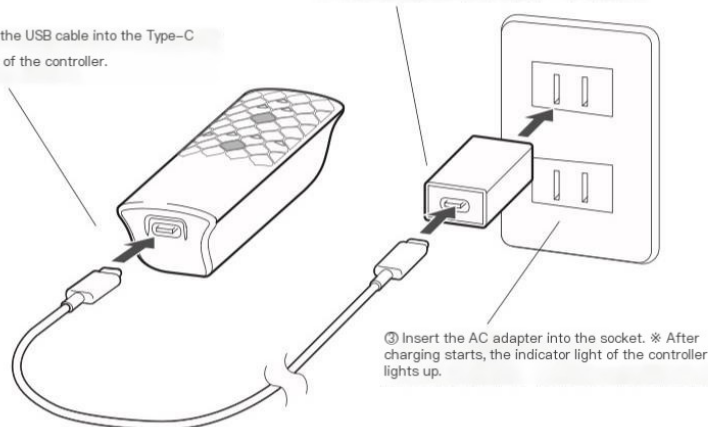

When not in use for a long time, please test run once a month, fully charge the battery, and then store it.

When the remaining battery of the product is less than 10%, the prompt light will flash to remind.

① Connect the AC adapter and USB cable.

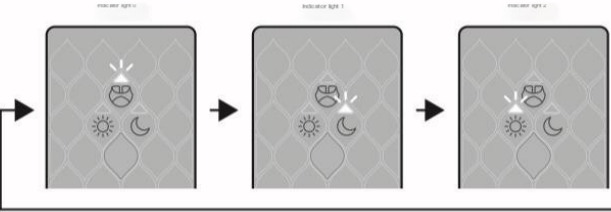

The USB cable can be used regardless of its length or short.

② Insert the USB cable into the Type-C interface of the controller.

④ After charging, unplug the AC adapter from the socket.

Scheme

design: Before using the product (D0)

After the subjects arrived at SGS, they sat quietly for 30 minutes in a laboratory at a temperature of $21 \pm 2^\circ\text{C}$ and $50 \pm 10\% \text{ RH}$. Laboratory technicians measured the Sebumeter basal values of facial skin on qualified subjects

Clean the face with a cleansing product and dry the skin with a non shavings dry tissue. Sit quietly for 30 minutes in a laboratory at a temperature of $21 \pm 2^\circ\text{C}$ and $50 \pm 10\% \text{ RH}$, evaluated by experts

Measurement of facial skin stratum corneum moisture content (Comeometer base value) by laboratory technicians;

Capturing facial Antera 3D images, Primos CR images, Visioscan by laboratory technicians on qualified subjects® VC20plus images, Dermalab Ultrasound images, and measurement of facial skin based values for Custometer, Colorimeter, and Hexameter

Laboratory technicians distribute test products, guide participants in their use according to product usage requirements and parts of use, and provide written testing precautions and product usage logs. Participants try out test samples on site under the supervision of laboratory technicians. If there are any adverse reactions, they need to fill in the usage logs in a timely manner

After 7 days of product use (D7)

After the subjects arrived at SGS, they sat quietly for 30 minutes in a laboratory at a temperature of $21 \pm 2^\circ\text{C}$ and $50 \pm 10\% \text{ RH}$, and the laboratory technician measured the Sebumeter instrument values of their facial skin

Clean the face with a cleansing product and dry the skin with a non shavings dry tissue. Sit quietly for 30 minutes in a laboratory at a temperature of $21 \pm 2^\circ\text{C}$ and $50 \pm 10\% \text{ RH}$

After 7 days of using the experimental product, the subjects filled out a self-evaluation questionnaire.

The laboratory technician weighed the experimental product and checked the product usage log, which was evaluated by experts

Capturing facial Antera 3D images, Primos CR images, Visioscan by laboratory technicians on qualified subjects® VC20plus images, Dermalab Ultrasound images, and measurement of facial skin Cutometer, Colorimeter, and Hexameter instrument values

Subject Leaving SGS

14 days after using the product (D14)

Data statistics: SPSS 28.0 was used for statistical analysis, and the test data was subjected to a normal distribution test. If the test data is normally distributed, paired t-tests were used for statistical analysis; If the test data is non normal distribution, the rank sum test method is used for statistical analysis. Rank sum test was used for statistical analysis of hierarchical data. The significance level of statistical methods is $p < 0.05$.

2. Evaluation parameters

2.1. Image acquisition

Antera 3D is used for image acquisition and photo analysis. The wrinkle length value represents the total length of all wrinkles in the selected area, the wrinkle average width value represents the average width of all wrinkles in the selected area, and the wrinkle average depth value represents the average depth of all wrinkles in the selected area. The maximum depth value of wrinkles represents the maximum depth of wrinkles in the selected area, and the number of wrinkles represents the total number of individual wrinkles in the selected area. The decrease in wrinkle analysis value indicates an improvement in wrinkles. The texture score represents different levels of roughness damage, divided into 5 levels: mild to moderate, obvious to severe to very severe. The average roughness **Ra** of the texture represents the average of all errors with respect to straight lines within the evaluation length, independent of the vertical direction. The maximum height **Rt** of the texture represents the maximum peak valley height of the profile in the evaluation length. The decrease in texture analysis values indicates an improvement in skin smoothness. The pigmentation score represents the level of pigmentation damage, and the change in value indicates that the degree of damage is less severe. The average concentration of pigmentation represents the average pigmentation concentration per unit area in the selected area, and the value decreases as the pigmentation concentration decreases. The maximum concentration of pigment deposition represents the maximum pigment deposition concentration per unit area in the selected area. A decrease in value indicates a decrease in pigment deposition concentration. The pore volume represents the total volume of skin depressions caused by the presence of pores in the selected area. The total pore area represents the area occupied by pores in the selected area, with the maximum depth being the maximum depth of pores in the selected area. The pore density is the average number of pores per square centimeter in the selected area. The pore count is the number of individual pores detected in the selected area. The pore analysis value decreases, indicating an improvement in pores.

Primos CR is used for facial image collection, skin wrinkles, and photo analysis. The decrease in wrinkle analysis value indicates an improvement in skin wrinkles.

Collagen probe Dermlab® Ultrasound is used for facial image acquisition and photo analysis. The increase in the analysis value of dermal thickness indicates an improvement in skin thickness; The increase in dermal density analysis indicates an improvement in skin density.

2.2. Skin oil content

Skin oil content tester **Sebumeter® SM815** is used to detect skin oil content. A decrease in measured values indicates a decrease in skin oil content.

2.3. Skin stratum corneum moisture content

Skin moisture content tester **Corneometer® CM825** is used to detect the moisture content of the skin stratum corneum. The measured value increases, indicating an increase in the moisture content of the skin stratum corneum.

Unless otherwise agreed in writing, this report is issued by our company in accordance with the General Terms of Service.

NO.988 West Jindu Road, Songjiang District, Shanghai, China 201612 | (86-21) 61915886 | (86-21) 61915878 | www.sgsgroup.com.cn | Songjiang District, Shanghai, China Zip code: 201612 | (86-21) 61915886 | (86-21) 61915878 | sgs.china@sgs.com

2.4. Skin surface analysis

Visioscan Skin Microscope® VC20plus is used for image acquisition and skin surface analysis. The increase in skin roughness S_{Er} analysis value indicates an improvement in skin roughness; The decrease in skin smoothness S_{Esm} analysis indicates an improvement in skin smoothness.

2.5. Skin color

The Colorimeter CL400 is used to detect skin color. The measured value of L * increases, indicating a brighter skin color; The decrease in the measured value of a * indicates an improvement in skin redness; The decrease in the measured value of b * indicates an improvement in skin yellowing; The increase in ITA ° measurement indicates a lighter skin color.

2.6. Skin heme content

Skin melanin and heme content tester® MX18 is used to detect skin heme content. The decrease in measured values indicates a decrease in skin heme content.

2.7. Skin melanin content

Skin melanin and heme content tester® MX18 is used to detect skin melanin content. The decrease in measured values indicates a decrease in skin melanin content.

2.8. Skin elasticity

Cutometer® Dual MPA580 is used to detect skin elasticity. The increase in measurement values of R2, R5, and R7 indicates an improvement in skin elasticity.

2.9. Skin Firmness

Cutometer® Dual MPA580 is used to detect skin tightness. The decrease in F4 measurement indicates an improvement in skin tightness.

2.10. Expert evaluation

Experts rate the skin condition of the subjects. Scoring criteria:

- (1) External eye corner wrinkles, nasolabial furrow wrinkles, and pore appearance: rating standards ranging from 0 to 9 (SGS standard graph)
- (2) Neck wrinkles: Rating criteria ranging from 0 to 9 (0=no wrinkles, 9=large, deep, and/or long wrinkles)

Unless otherwise agreed in writing, this report is issued by our company in accordance with the General Terms of Service.

The General Terms of Service shall be printed on the back of the original report paper, or through <https://www.sgs.com/en/Terms-and-Conditions-Query>. Please pay special attention to the relevant clauses related to liability limitation, compensation, and jurisdiction. The holder of any report should be aware that the content of this report only reflects SGS's limitations under customer instructions and the conclusions drawn at the time. SGS is only responsible to its clients, and this report does not exempt all parties to the transaction from their rights and obligations under the transaction documents. Without written approval from our company, this document cannot be reproduced, except for the entire text. Any unauthorized modification, forgery, or distortion of the content and form of the report is an illegal act, and violators will be held legally responsible. Unless otherwise stated, the results shown in this test report only pertain to the tested sample, which will only be retained for 30 days.

2.11. Subject self-assessment

Evaluation of product efficacy and satisfaction by participants.

Scoring criteria: A score of 0 is average, satisfaction gradually increases from 1 to 5, and a score of 5 is very satisfactory. Satisfaction is scored as $\frac{\text{number of participants}}{\text{total number of effective participants}} \times 100\%$

3. Selection and exclusion criteria for subjects

The subjects for this test were selected from the subject information database of the CPCH efficacy laboratory, and healthy subjects who met the following inclusion criteria and did not meet the following exclusion criteria were selected:

3.1. Inclusion Criteria

- Healthy female, age: 30-55 years old;
- Self perceived facial skin as dull, lacking elasticity and firmness, sagging, rough, and lacking fullness;
- Wrinkles in the outer corners of the eyes are graded 3-6 (according to the SGS standard pattern);
- Nasolabial furrow wrinkles (statutory wrinkles) are graded 3-6 (according to SGS standard atlas);
- Having at least 2 color spots of no less than 2mm on the face;
- The moisture content in the stratum corneum of one random facial skin is less than 60 C.U;
- There are no obvious skin lesions, scars, hair or other conditions on the facial skin;
- Able to cooperate well with the experimental plan and maintain a regular lifestyle during the research period.

3.2. Exclusion criteria

Anyone who meets any of the following conditions must be excluded from this study:

- Those who do not agree to sign the informed consent form;
- Those who do not agree to sign the photo declaration;
- Those who are unwilling to comply with the requirements of the plan;
- Participate in any other clinical researchers at the same time;
- Self reported pregnancy, lactation, and preparation period;
- Receiving medication during the study period;
- Subjects with infectious skin diseases or atopic dermatitis;
- Individuals with skin abnormalities such as nevi and telangiectasia at the test site;
- Individuals with keloid constitution, facial melanosis, photosensitivity, pigmentation disorders, long-term use of steroid drugs, or telangiectasia caused by liver dysfunction;

Unless otherwise agreed in writing, this report is issued by our company in accordance with the General Terms of Service.

The General Terms of Service shall be printed on the back of the original report paper, or through <https://www.sgs.com/en/Terms-and-Conditions-Query>. 4. Evaluation results

4.1. Skin wrinkles (Antera 3D) (neck)

Antera 3D is used for image acquisition and photo analysis. The wrinkle length value represents the total length of all wrinkles in the selected area, the wrinkle average width value represents the average width of all wrinkles in the selected area, and the wrinkle average depth value represents the average depth of all wrinkles in the selected area. The maximum depth value of wrinkles represents the maximum depth of wrinkles in the selected area, and the number of wrinkles represents the total number of individual wrinkles in the selected area. The decrease in wrinkle analysis value indicates an improvement in wrinkles.

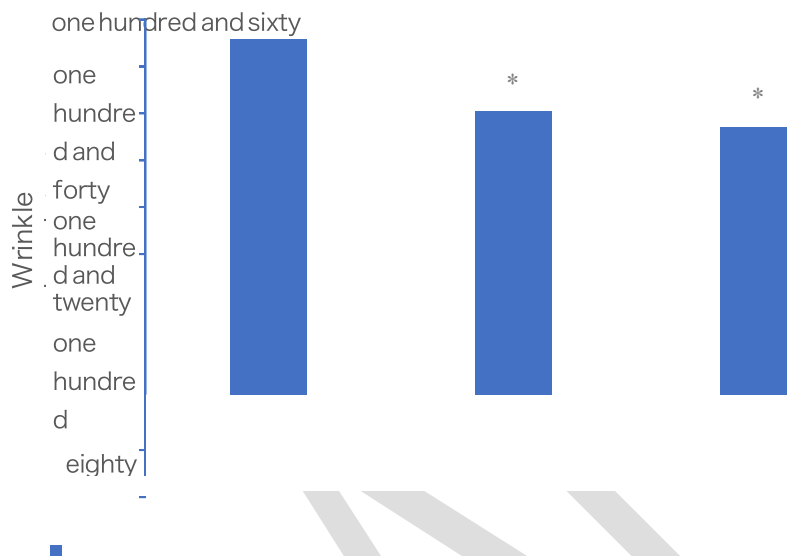

Figure 1.1 Wrinkle length

Note: * indicates a significant difference in the analysis value compared to before using the product ($p < 0.05$)

4.2. Skin texture (**Antera 3D**) (cheeks)

Antera 3D is used for image acquisition and photo analysis. The texture score represents different levels of roughness damage, divided into 5 levels: mild to moderate, obvious to severe to very severe. The average roughness R_a of the texture represents the average of all errors with respect to straight lines within the evaluation length, independent of the vertical direction. The maximum height R_t of the texture represents the maximum peak valley height of the profile in the evaluation length. The decrease in texture analysis values indicates an improvement in skin smoothness.

Figure 2.1 Texture score

4.3. Antera 3D (cheeks)

Antera 3D is used for image acquisition and photo analysis. The pigmentation score represents the level of pigmentation damage, and the change in value indicates that the degree of damage is less severe. The average concentration of pigmentation represents the average pigmentation concentration per unit area in the selected area, and the value decreases as the pigmentation concentration decreases. The maximum concentration of pigment deposition represents the maximum pigment deposition concentration per unit area in the selected area. A decrease in value indicates a decrease in pigment deposition concentration.

4.4. Skin pores (Antera 3D) (cheeks)

Antera 3D is used for image acquisition and photo analysis. The pore volume represents the total volume of skin depressions caused by the presence of pores in the selected area. The total pore area represents the area occupied by pores in the selected area, with the maximum depth being the maximum depth of pores in the selected area. The pore density is the average number of pores per square centimeter in the selected area. The pore count is the number of individual pores detected in the selected area. The pore analysis value decreases, indicating an improvement in pores.

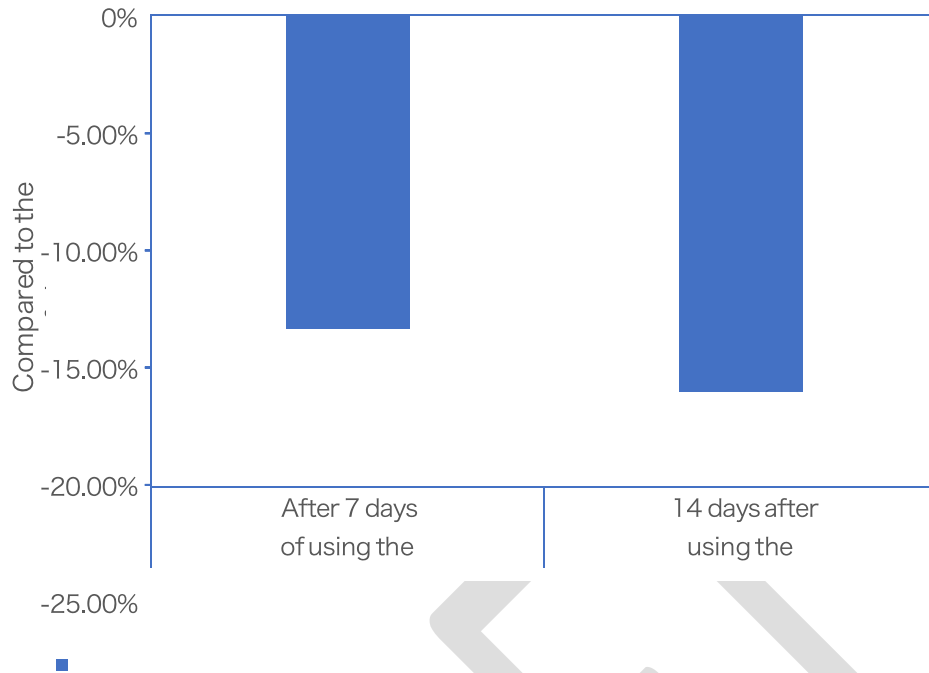

Figure4.15 Change rate of pore quantity

$$\text{Change rate} = (\text{analysis value after using the product} - \text{analysis value before using the product}) \div \text{analysis value before using the product} \times 100\%$$

Compared to before using the product:

After 7 days of using the product, there was no significant reduction of 10.94% in pore volume, 11.05% in pore area, 8.83% in the deepest value of pores, 16.04% in pore density, and 16.61% in pore quantity in the cheek analysis area.

After 14 days of using the product, the cheek analysis area showed a significant decrease of 22.12% in pore volume, 21.24% in pore area, 9.14% in deepest pore value, 17.90% in pore density, and 19.93% in pore quantity.

4.16. Expert evaluation

Table 1 Expert Evaluation Results

Evaluation project	mean value			Rate of change		Significance p -value compared to before use	
	D0	D7	D14	D7	D14	D7	D14
Wrinkles in the outer corner of the eye	four point two seven	four point zero eight	three point eight eight	-4.61%	-9.22%	<0.001	<0.001
nasolabial fold	four point one seven	four point zero six	three point seven seven	-2.55%	-9.45%	zero point zero one six	<0.001
Neck wrinkles	three point five eight	three point four seven	three point two six	-2.97%	-8.90%	zero point zero one six	<0.001
Cheek pores	four point five two	four point three six	four	-3.36%	-11.41%	zero point zero two	<0.001

Scoring criteria:

- (1) External eye corner wrinkles, nasolabial furrow wrinkles, and pore appearance: rating standards ranging from 0 to 9 (SGS standard graph)
- (2) Neck wrinkles: Rating criteria ranging from 0 to 9 (0=no wrinkles, 9=large, deep, and/or long wrinkles)

Compared to before using the product,

After 7 days of using the product, the average score of external eye wrinkles significantly decreased by 4.61%, the average score of nasolabial furrow wrinkles significantly decreased by 2.55%, the average score of neck wrinkles significantly decreased by 2.97%, and the average score of cheek pores significantly decreased by 3.36%.

After 14 days of using the product, the average score of external eye wrinkles significantly decreased by 9.22%, the average score of nasolabial furrow wrinkles significantly decreased by 9.45%, the average score of neck wrinkles significantly decreased by 8.90%, and the average score of cheek pores significantly decreased by 11.41%.

4.17. Subject self-assessment

Unless otherwise stated in writing, this report is issued by our company in accordance with the General Terms of Service.

The General Terms of Service shall be printed on the back of the original report paper, or through <https://www.sgs.com/en/Terms-and-Conditions-Query>. Table2 Self evaluation results of subjects (satisfaction)

problem	Satisfaction	
	D7	D14
Skin firmness enhancement effect	70%	94%
Skin elasticity enhancement effect	70%	94%
Brightening skin tone effect	73%	94%
Skin Gloss Enhancement Effect	70%	97%
Improvement effect on skin roughness	70%	97%
Skin tenderness improvement effect	64%	91%
Improvement effect of overall facial rejuvenation	73%	100%
Improvement effect of statutory patterns	76%	85%
Improvement effect of fish tail pattern	73%	91%
Improvement effect of neck wrinkles	70%	88%
The improvement effect of raising head wrinkles	70%	91%
Improvement effect of facial fine lines	73%	97%
The tightening effect of cheeks	70%	91%
Improvement effect on coarse pores/effect on fine pores (filled in by subjects who believe their skin has coarse pores) (N=16)	38%	100%
Improvement effect of acne/acne (filled in by subjects who believe they have acne/acne) (N=3)	100%	100%

Scoring criteria: A score of 0 is average, satisfaction gradually increases from 1 to 5, and a score of 5 is very satisfactory.

Satisfaction is scored as >3 points, with the number of participants divided by the total number of effective participants × 100%

After 7 days of using the product, 70% of the subjects showed an improvement in skin firmness; 70% of the subjects showed an improvement in skin elasticity; 73% of the subjects showed a brightening effect on their skin tone; 70% of the subjects showed an improvement in skin glossiness; 70% of subjects showed improvement in skin roughness; 64% of subjects showed improvement in skin tenderness; 73% of the subjects showed overall improvement in facial rejuvenation; 76% of the subjects showed improvement in their tattoos; The improvement effect of crow's feet pattern in 73% of subjects; 70% of subjects showed improvement in neck lines; 70% of the participants showed improvement in raising their head wrinkles; The improvement effect of facial fine lines on 73% of subjects; 70%

SGS is not a medical device clinical trial institution and does not have the qualification to conduct medical device clinical trials. Due to updates in regulations and rules, such products may be classified as medical devices in China, and **SGS** is not responsible for identifying such information. The applicant needs to closely monitor and identify whether such products are classified as medical devices. If the product is classified as a medical device, the applicant shall fulfill relevant obligations in accordance with the requirements of the Regulations on the Supervision and Administration of Medical Devices, and entrust a qualified clinical trial institution for medical devices to conduct separate tests. This evaluation report is only used for customer research, teaching, internal quality control, product research and development, and is for internal reference only and does not have a probative effect on society.
